Overview of Multi-disease Integrated Testing

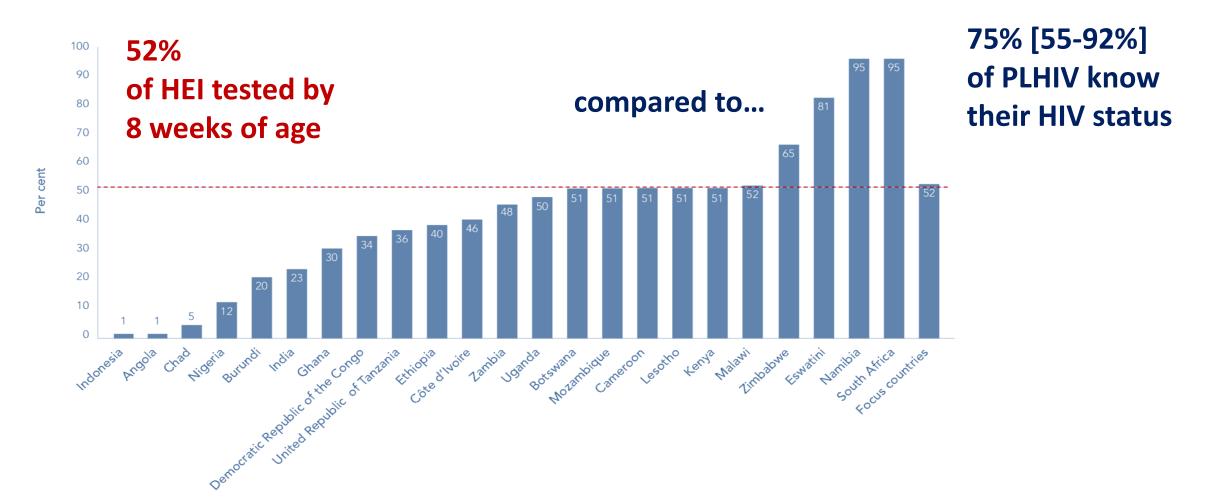

May 2019

Across sub-Saharan Africa, infant case finding lags behind testing rates in adults

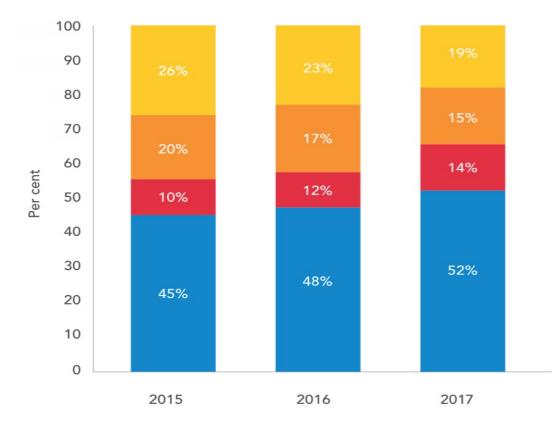

Progress in the 1st 90 for infants is not being realized at a similar rate as for adults

Figure 11. Nearly half of HIV-exposed infants are not tested Percentage of children born to women living with HIV who were tested for HIV within eight weeks of birth, 23 focus countries, 2017

Though more people are being diagnosed and placed on treatment, the gap in the 3rd 90 is growing

EASTERN AND SOUTHERN AFRICA

Testing gap: Percentage of people with HIV who do not know their status and are not on treatment

Treatment gap: Percentage of people living with HIV who know their status but are not on treatment

Viral suppression gap: Percentage of people living with HIV who are on treatment but not virally suppressed

Virally suppressed: Percentage of people living with HIV who are on treatment and virally suppressed

"The 'viral suppression gap' is growing more prominent." - UNAIDS 2018

Point-of-care (POC) testing offers an opportunity to address coverage and quality gaps in molecular testing

Services to manage PLHIV have been tremendously decentralized

Centralized laboratory systems maximize throughput but often do so at the expense of rapid result availability

 May lead to missed opportunities for more critical clinical decisions, such as HIV diagnosis for infants or management of clients with unsuppressed VL

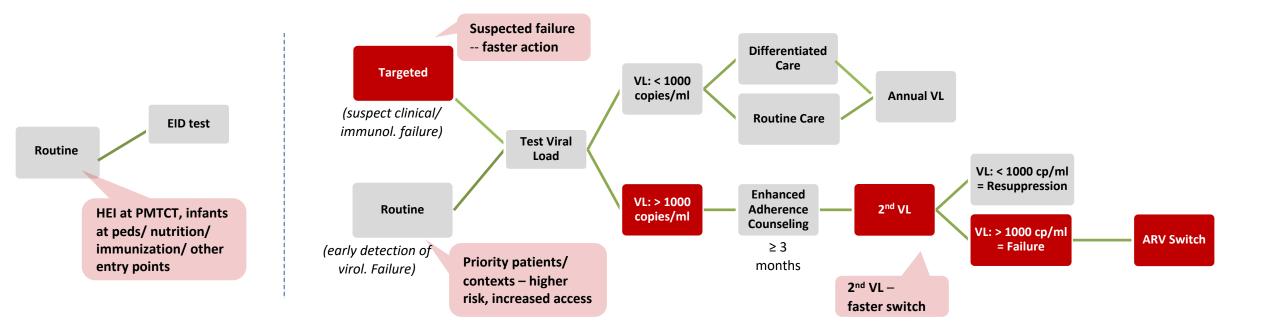

POC testing for EID and CD4 has been shown to increase rates and timeliness of clinical action¹ (linkage to care, ART initiation)

 But management of decentralized testing fleets can be capital, resource intensive and complex without accompanying supportive systems

Initial implementation strategy to offer POC testing is **Multidisease integrated testing** on existing GeneXpert devices. Integration represents an opportunity to increase access and minimize costs for POC testing

POC testing is currently being considered for certain priority populations who could most benefit from rapid DNA-PCR test results

HIV exposed infants (HEI)

Children/adolescents

- to ensure timely diagnosis and improve rates of early treatment initiation
- Pregnant and breast feeding HIV+ women
- to promote re-suppression and avert vertical transmission (20-25% risk of MTCT from women with unsuppressed VL)
- to ensure early detection of virological failure , can have higher rates of unsuppressed VL

Persons with advanced HIV disease

• ensure more rapid viral suppression and lower the risk of disease progression

Patients on ART failing 1st VL

• to ensure early ARV switch, can have increased morbidity & mortality with prolonged elevated VL

| | Cepheid GeneXpert | | DRW Samba II | | Abbott m-PIMA (formerly AlereQ) | |
|----------------|-----------------------------|-------------------|----------------------|---------------------------|------------------------------------|---------------------------|
| Assay | HIV-1 Qual (EID) | HIV-1 VL | Qual Test for EID | HIV-1 Semi-Q test (VL) | HIV-1/2 Detect (EID) | HIV1/2 VL |
| Regulatory | WHO PQ, CE-IVD | WHO PQ, CE-IVD | CE-IVD | CE-IVD | WHO PQ, CE-IVD | PQ under review CE-IVD |
| Sample | 1 DBS, 100ul WB | 1ml plasma | 125ul WB | 200ul plasma | 25ul WB | 50ul plasma |
| Time to result | 1h55m (DBS) 95 mins (WB) | 95 mins | 95 mins | 90 mins | 52 mins | 70 mins |

A large existing fleet of GeneXpert devices established through National TB Programs has multiplexing capability to run different disease assays

| | Cepheid GeneXpert | | | | |
|----------------|----------------------------|-------------------|-------------------|-------------------|--|
| Assay | HIV-1 Qual (EID) | HIV-1 VL | HCV VL | HPV VL | |
| Regulatory | WHO PQ, CE-IVD | WHO PQ, CE-IVD | WHO PQ, CE-IVD | WHO PQ, CE-IVD | |
| Sample | 1 DBS, 100ul WB | 1ml plasma | 1ml plasma | Cervical swab | |
| Time to result | 1h55m (DBS) 90 min (WB) | 90 mins | 90 mins | 60 mins | |

Over 2,800 GeneXpert systems have already been procured for TB testing in PEPFAR-focus countries.

Current utilization of existing devices is generally less than 50%.

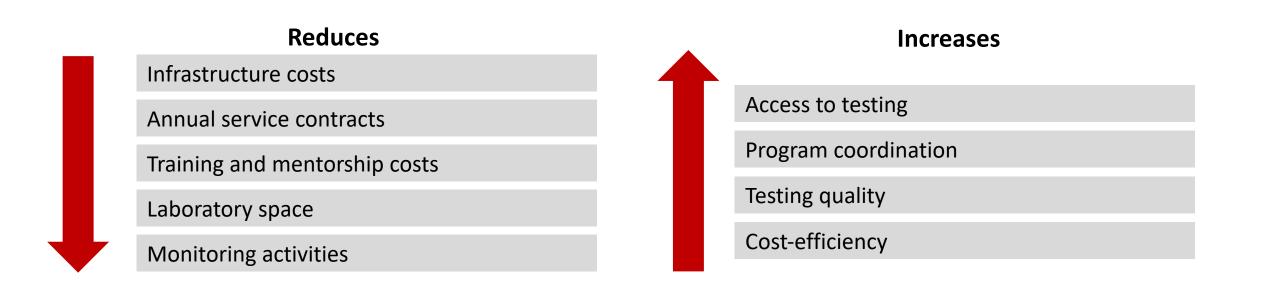

HBV VL released in Dec 2018

A range of centralized platforms can also offer integrated testing

National programs have invested heavily in nucleic acid amplification testing (NAT) platforms (which detect DNA and RNA) that are capable of testing a range of diseases and may have spare capacity

²Cobas 4800 offers regulatory-approved EID; ³Currently under validation in the US

Multi-disease integrated testing brings benefits to all programs sharing infrastructure:

- Cost-sharing for fixed costs to maximize utilization and reduce all-in cost per test
- Increasing access to devices and sites that would be otherwise unaffordable
- Improved quality by increasing and coordinating monitoring and training
- Increased negotiating power for test prices and S&M
- Leverage on data management, sample transport and supply chain systems

Integration of care services can be realized in most of the system areas and is expected to generate efficiencies and better services provided to the patients

WHO: Considerations for Adoption and Use of Multi-disease Testing Devices

There many areas where multiplexing can yield improved efficiency, not only though **higher utilization** of the device, but also through leveraging and **combining laboratory support systems**, such as training, mentorship, and connectivity

WHO, 2017: Considerations for adoption and use of multidisease testing devices in integrated laboratory networks

Integration Implementation Framework

| | 1 | Stakeholder Engagement | 2 Site Mapping & Resource Assessme | | 4 Operational Plan and Costing | 5 Phased Implementation | 6 Monitoring and Evaluation |
|----------------|----------------------|---|--|---|--|--|---|
| Key Activities | 1. 2. 3. 4. | Advocacy with key opinion leaders for policies enabling TB/HIV/HCV/HPV Integration Consultative meetings Agreement on well- defined responsibilities Commitment to contribute to the program and take action | 10H (NTP, NACP, HIV, H 1. Site mapping with existing and expected devices 2. Capacity assessment: existing and projected (HR, infrastructure, equipment, S&M, ST, etc.) 3. Current and future resource assessment | 1CV, Cancer program, a 1. Testing models based on assessment 2. Identification and mapping of target facilities - onsite, referrals 3. Set volume targets, and define test/sample type prioritization, as appropriate 4. Timeline for phased implementation | Program plan (Who, When, What, Where, How) Site & product selection Process flows and SOPs | nd Partner Coordination Pilot and if workable, scale- up 1. Pilot sites visit & coordination 2. Conduct trainings and awareness campaign 3. Lab workflow and patient flow optimization 4. Pilot findings dissemination (gaps, actions and best practices) 5. Scale-up plan | Routine monitoring and supportive supervision visits Tracking and Reporting against KPIs Identification of low performance service areas Service improvement plan of actions |
| Outcome | | ong commitment & aboration between programs | Leverage existing resources & share operational costs to ensure sustainability | Achieve milestones according to set targets | Operationalize with well defined roles and cost implications | Integrated services available across the country | Anticipate and address challenges, share best practices |

Thank you!
